

CT CARDIAC CALCIUM SCORING TESTS

Discounted to **\$79** throughout January and February!

CT cardiac calcium scoring is recommended for women ages 55 to 75, men ages 45 to 75, and those at increased risk for heart disease. The calcium score directly corresponds to the likelihood of having heart disease or a heart attack. The lower the calcium score and percentile rank, the less likely a cardiac event. This test helps physicians determine what preventive or corrective actions, including drug therapies or lifestyle modifications, may be warranted based on results.

For more information or to schedule an appointment, call (706) 723-8860.

**Requires a physician referral and takes approximately ten minutes to complete. CT cardiac calcium scoring is not typically covered by health insurance plans but low cash-pay pricing is available.*
